

From: "Stan Sandler" <sandler@AURACOM.COM>

"Coelho (1991) found in tethered honeybees the maximum force production of drones to be twice that of workers"

3.95 mN (drone)

1.73 mN (worker)

"but on a body weight basis to be similar"

19.4 N/kg and 21.0 N/kg

So, in theory, if they all get together and pulled, they could move the beehive.
